SUMMARY

Frontend Developer Intern with early-career experience building role-based workforce analytics dashboards and API-driven workflows at OrgPath. Full-stack AI product builder and founder of PrepInterview AI, a live interview-preparation platform developed using React, FastAPI, PostgreSQL and OpenAI APIs. Demonstrated ability to design and deploy end-to-end cloud applications that improve decision-making and user engagement. Seeking to apply full-stack AI expertise to drive innovative product solutions.

EDUCATION

Arizona State University, Ira A. Fulton Schools of Engineering

Aug 2022 - May 2026

B.S., Computer Science, Data Science

Tempe, AZ

• **GPA:** 3.89

• **Achievements:** Summa Cum Laude

• **Coursework:** Data Structures and Algorithms, Operating Systems, Database Management, Machine Learning, Computer Network Security, Software Engineering, Data Visualization

TECHNICAL SKILLS

Languages: Python, JavaScript/TypeScript, Java, C/C++, SQL, R

Frontend: React, Vite, Tailwind CSS, React Router, Axios

Backend / APIs: FastAPI, Node.js, Express.js, REST APIs, SQLAlchemy, Alembic, JWT, bcrypt

Databases: PostgreSQL, Neon, SQL, JSONB

AI / Cloud: OpenAI API, Tavily API, Resend, Vercel, Render, Docker, GitHub

EXPERIENCE

OrgPath - Enterprise Succession Planning & Workforce Analytics Platform

Jan 2026 - May 2026

Frontend Developer Intern

Tempe, AZ (Remote)

Frontend Developer Intern at OrgPath, where I helped build a role-based workforce analytics and succession planning platform for employees, team leads, managers, and executives. I worked on React dashboards, API-driven workflows, reporting modules, and data visualizations connected to Node.js/Express APIs and PostgreSQL.

- Spearheaded the design and development of a workforce analytics platform that consolidates employee assessments, leadership evaluations, succession planning workflows, and organizational performance metrics into a centralized application used by employees, team leads, managers, and executives.
- Developed role-based React dashboards integrated with Node.js/Express APIs and PostgreSQL, delivering real-time visualizations for talent density, succession readiness, organizational health, performance analytics, and leadership pipeline insights.
- Collaborated with stakeholders, product sponsors, frontend and backend engineers to define system requirements, design scalable workflows, integrate APIs, and translate business objectives into production-ready solutions.
- Engineered reusable UI components, role-based access workflows, and reporting modules, and contributed to technical documentation, sprint execution, deployment planning, and successful product delivery

PROJECTS

PrepInterview AI prepinterviewai.com

- Founded and built a live AI interview-preparation platform that converts job descriptions and URLs into personalized prep plans, study notes, role-specific exams, mock interviews, progress analytics, and calendar-driven preparation workflows.
- Architected a full-stack system with React/Vite frontend, FastAPI backend, Neon PostgreSQL, SQLAlchemy models, Alembic migrations, JWT authentication, user-scoped persistence, CORS hardening, and REST APIs deployed across Vercel and Render.
- Integrated OpenAI and Tavily pipelines for job-title/company extraction, skill analysis, retrieval-augmented notes, adaptive question generation, answer scoring, mock-interview feedback, and AI-assisted job-description summaries.
- Built production features including Resend email OTP verification from a verified domain, browser capture-bubble extension, saved-job workflows, deleted-job recovery, dark mode, and live deployment at prepinterviewai.com.

PixelPlanes pixelplanes.app

- Built and launched a real-time multiplayer browser dogfight game supporting room-code matches for up to six players, synchronized combat, respawning, scoring, weather, and shared world events.
- Engineered custom 2D aircraft physics, collision detection, AI opponents, fuel and repair systems, bullets, target-seeking rockets, landing mechanics, and responsive keyboard controls.
- Developed low-latency multiplayer infrastructure using Node.js and WebSockets, with interpolation and client-side prediction to deliver smoother international gameplay.
- Implemented cross-browser WebRTC voice chat with STUN/TURN connectivity and deployed the React/Vite frontend on Vercel with realtime services on Render.

PropertyLens | Property Intelligence and Risk Scanner

- Built a NJ real-estate intelligence platform for evaluating listings through risk scores, map overlays, saved alerts, compare workflows, seller questions, and report-export views.
- Implemented Express listing APIs with normalized filters for price, acreage, city, ZIP, verification, and result limits.
- Developed property-scoring and risk-evaluation workflows by aggregating real-estate, zoning, flood, parcel, utility, rail, and amenities datasets into a unified decision-support interface.

DormDash | Student Moving & Logistics Marketplace

- Engineered a logistics marketplace for student relocations, enabling scheduling of moves, vehicle/helper selection, supply management, and real-time booking tracking.
- Built customer and driver applications with authentication, profile management, wallet & payment integration, order-status workflows, dynamic pricing, and Haversine distance-based estimates.

COOK IA | AI-Powered Recipe Discovery & Smart Cooking Assistant [Cook AI](#)

- Built a full-stack cooking assistant that suggests personalized recipes using external food APIs, ingredient matching, cuisine filters, dietary preferences, and preparation-time constraints.
- Developed AI-guided cooking mode with voice-assisted steps, interactive timelines, automated timers, ingredient tracking, speech controls, and responsive multi-page UI flows.
